Preface

“You have breast cancer” is a phrase that every hour, about thirty women in the world will hear and we know how the words can make the patients deaf momentarily. As unpleasant as society has perceived cancers, cancer treatment has been even more negatively portrayed as deteriorating procedures. This misunderstanding and fear could deprive potentially curable patients of the treatment, and absolutely, we are talking about a cure. Despite breast cancer being the most common cancer in women and its increasing prevalence, rapid advancement in novel drugs and treatment modalities has led to a major increment in treatment outcomes especially survival. The earlier the patients are diagnosed, the more chance of cure. The way we physicians see breast cancer is completely different from the past and we believe there is a need for a mutual understanding in our society. This is why this book was originated – to serve as a comprehensive guide of breast cancer to patients, their relatives, or anyone interested.

Writing a book is always a team effort and we are thankful for all who contributed. All chapters were written by field experts from the country’s leading medical school - Faculty of Medicine, Chulalongkorn University and King Chulalongkorn Memorial Hospital, Thai Red Cross Society, Bangkok, Thailand.

Now It is time to turn the page. This book will calm your pace down instead of giving you a heart attack next time you hear ‘breast cancer’. We hope that readers will see breast cancer in a more hopeful way as we see and enjoy the book as much as we do. Have a beautiful read!

content

Breast function and development	7	Breast cysts	49
Breast components	9	How to interpret a BIRADS score?	50
Understanding the location	10	Breast MRI	51
Warning signs of breast abnormalities	11	A breast biopsy is not as frightening as it sounds	52
Palpable breast mass	12	Core needle biopsy vs fine needle aspiration	53
Nipple discharge	13	Breast biopsy preparation	54
Breast cancer	14	Principles of breast cancer treatment	55
Incidence of breast cancer	15	Treatment according to breast cancer staging	56
Breast cancer stages	16	Surgery in early breast cancer	58
Stage 0-2 breast cancer	18	Role of surgery in breast cancer	59
Stage 3-4 breast cancer	19	Breast-conserving surgery	60
Ductal carcinoma in situ	20	Steps in breast conserving therapy	62
Invasive breast cancer	22	Steps in total breast removal (mastectomy)	63
Features of cancer cells	23	Systemic treatment	64
Grading	24	Treatment options and sequences	65
Severity	25	Chemotherapy	66
Hormonal responsiveness	26	Side effects of chemotherapy	67
ER-positive and HER-2-negative	28	Hormone therapy	68
HER2-positive	29	Side effect of hormone therapy	69
ER-negative and HER-2 negative	30	Targeted therapy (anti-HER2)	70
Causes of breast cancer	31	New hormonal therapy	71
Factors associated with breast cancer	32	Radiation therapy in breast cancer	72
How to lower your chance of getting breast cancer	33	Radiation therapy techniques	73
Abnormal breast changes that do not increase breast cancer risk	34	How does radiation kill cancer cells?	74
Breast cancer signs and symptoms	35	Why is radiation therapy needed after breast surgery?	75
Evaluating a breast mass	36	Radiation therapy after total breast removal (mastectomy) can reduce tumor recurrence and increase the chance of long-term survival	76
Breast cancer screening methods	37	Radiation therapy after breast conserving surgery can reduce tumor recurrence and increase the chance of long-term survival	77
How effective are mammograms?	38	Who needs radiation therapy after total breast removal (mastectomy)?	78
Breast X-ray (mammogram)	39	Who needs radiation therapy after breast conserving surgery	79
Mammogram vs ultrasound	40		
Who should get only a breast ultrasound ?	41		
Breast cancer risk	42		
When to start having a mammogram?	44		
Prepare yourself for a mammogram	45		
Prepare yourself for a breast MRI	46		
What can we see from the breast imaging?	47		
Calcifications in the mammogram	48

The common side effects of radiation therapy	80	Treatment guideline for HER2-positive breast cancer patients	106
Will the radiation affect nearby organs?	81	Treatment guideline for hormone receptor-negative and HER2-negative breast cancer patients	107
Heart protection techniques that the radiation oncologist might use during breast radiation	82	Side effects from systemic treatment	108
Why do patients need to come to the hospital every day for radiation?	83	Stereotactic radiotherapy /stereotactic radiosurgery	109
When can radiation therapy be accelerated?	84	The role of radiotherapy in metastatic breast cancer patients as palliative care to manage the symptoms	110
Steps in radiation treatment	86	Side effects of radiation	112
Preparing yourself for breast radiation therapy	90	Sex and fertility	113
Frequently asked questions about breast radiation treatment	92	Tumor genetic test	114
Chemotherapy and targeted therapy procedure before surgery (neoadjuvant treatment)	98	Follow-up after the treatment	115
Systemic treatment in stage IV breast cancer patients	100	Breast imaging after treatment	116
New cancer drugs	103	Complementary and alternative medicine	117
Treatment guideline for hormone receptor positive, HER2-negative, and slow progressing disease	104	Breast cancer care team	118
Treatment guideline for hormone receptor-positive, HER2-negative, and fast growing disease	105	Cannabis	120
		Trusted websites for breast cancer patients	121
		Diet for cancer patients	122
		Metastatic breast cancer	124
		Palliative care team and end of life care	125

To all breast cancer
patients and their
families.

A great inspiration
to improve
the quality
of cancer
treatment.

Breast function and development

The breasts are specialized organs. In women, they produce breast milk – an important source of nutrition for infants. The breasts also give women a feminine appearance.

The development of human breasts starts in an unborn baby at week 5th of pregnancy, when the baby is still called an Embryo.

During puberty, female breasts enlarge due to the influence of sex hormones. Breast ducts, lobules and surrounding connective tissue grow in size and number. This process continues until about the age of 20, but the breasts can grow further during pregnancy.

Surrounding
connective tissue

Glandular tissue

Breast components

2

The breast tissue is made of two main components: glandular tissue and the surrounding connective tissue.

Glandular tissue responds to sex hormones which stimulate breast growth. Glandular tissue consists of 2 components – the ductal part and the lobular part. The female breast contains 15-20 sections, or lobes, which surround the nipple. Each lobe consists of multiple lobules. Lobules contain small glands that produce breast milk. Many lobules form into the terminal ductal lobular units (TDLUs). Each TDLU is connected to a duct. Many small ducts drain to larger ducts which finally carry milk to the nipple. The number of lobes and TDLUs vary between person.

During the embryonic stage, the breast has only 3 layers of cells. The outermost layer, called the **ectoderm**, gives rise to the mammary ducts and lobules, and finally covers them. Portions of the ectoderm become ligaments called **Cooper's ligaments**, which run from the superficial to the deep layers of the breasts, helping to maintain breast shape.

Understanding the location

Breasts can be divided by virtual lines running vertically and horizontally, intersecting at the nipple. The lines form four regions called quadrants.

Breast tumors typically originate at the end units of the breast, called TDLUs. Other non-tumor abnormalities can occur anywhere in the breast. Most breast conditions are benign; however, there is a risk of developing breast cancer, and it increases with age.

Warning signs of breast abnormalities

The most common symptoms are...

1 Pain or tenderness

2 Palpable mass

3 Nipple discharge.

These symptoms are non-specific and not always caused by cancer. However, you are advised to seek medical attention if you experience these symptoms.

Breast pain

Pain is the most common condition that draws medical attention, but it is usually not caused by cancer. Breast pain can be cyclical (linked to the menstrual cycle) or non-cyclical. Cyclical breast pain is caused by the hormonal change during the menstrual period. Non-cyclical breast pain is often localized, and is caused by trauma or infection. However, pain may occur in up to 10% of breast cancer patients.

Palpable breast mass

An abnormal breast mass is lumpy, unlike the texture of normal breasts.

Cancer often presents as breast mass, but most breast lumps or masses are not cancerous.

Many benign conditions can cause breast lumpiness, for example, cysts, fibroadenoma, and more.
